

The Beyond-Presence gate collapses under recognition saturation

Recall-arm vs recognition-arm η^2 among above-floor brands, each with its permutation null
Recognition carries almost no provider variance ($\eta^2_{C_p} \approx 0$), so the paired gate measures recall asymmetry, not a contrast.

H_Provider_Beyond_Presence — numerical criterion met ($\delta\eta^2 = 0.505$, $p = 1e-4$) but saturation-collapsed; NOT a dissociation.
