

A precise null, not an absence of power

The primary association against the detectable-effect threshold ($n = 53$, above the floor of 45).

The critical $|\rho|$ at $p=.05$ (≈ 0.27) is below the 0.30 CONFIRMED band — a band-level effect was reachable. The estimate sits at ~ 0 and its CI excludes the band.

H_IL_Consistency FALSIFIED → CLEAN-NULL: $\rho = -0.008$, $p = 0.955$, $n = 53$; powered (detectable $|\rho| \approx 0.27 < 0.30$).
